

The **First Trust Low Duration Opportunities ETF** is an actively managed exchange-traded fund (ETF) that primarily seeks to generate current income with a secondary objective of capital appreciation.

Under normal market conditions, the fund will seek to achieve its investment objectives by investing at least 60% of its net assets (including investment borrowings) in investment grade, mortgage-related debt securities and other mortgage-related instruments tied to residential and commercial mortgages. We believe mortgage-backed securities (MBS) offer attractive income generating potential relative to other high quality fixed income assets. An investment in the fund may offer the following advantages:

- Attractive level of current income with an effective duration target of 3 years or less;
- Limited price sensitivity due to a focus on managing and limiting the average portfolio duration;
- High asset credit quality with at least 60% of assets in the government-sponsored mortgage sector and less expected price sensitivity to the credit cycle;
- Large and liquid asset class effectively accommodates efficient portfolio rebalancing.

### DURATION AS A TOOL TO HELP MANAGE RISK

Some securities have greater sensitivity to changes in interest rates. By using duration as an estimate of interest rate sensitivity, investors don't have to guess at this exposure. A security's duration is a measure of its price sensitivity to interest rate movements. In other words, it tells the investor how the security's price is likely to change when market interest rates go up or down.

In general, each year of duration represents an expected 1% change in the value of a security for every 1% change in interest rates. For example, if a portfolio of securities has an average duration of three years, its value can be expected to fall about 3% if interest rates rise by 1%. Conversely, the portfolio's value can be expected to rise about 3% if interest rates fall by 1%.

Prices of securities with lower durations tend to be less sensitive to interest rate changes than securities with higher durations. As a result, lower duration securities tend to hold up better in rising interest rate environments than those with longer durations.

Active portfolio management, which includes managing duration, may help mitigate the impact that rising rates may have on returns.

### WHY ACTIVE PORTFOLIO MANAGEMENT?

Typically, ETFs that follow an indexing approach invest a higher percentage of the fund's assets in securities within the index with the largest current market issuance, which exposes investors to potentially overvalued or poorly structured market sectors. Most index ETFs that invest in mortgage-backed securities are currently trading with longer durations, leading to greater sensitivity to longer-term interest rate movements. In contrast, an actively managed ETF can be managed to stay within lower duration targets. When selecting the portfolio for the First Trust Low Duration Opportunities ETF, the portfolio management team uses top-down research focused on the global economy, macro trends in the fixed income market as well as ongoing valuations and trends of core MBS sectors. The portfolio managers believe thorough and continuous monitoring of overall housing market fundamentals, quantitative portfolio modeling, and the ability to rebalance the portfolio to stay within the fund's three-year duration target is critical to achieving higher risk-adjusted returns. Quantitative portfolio modeling is used to evaluate expected relative portfolio performance and optimally create an efficient strategy based on the following variables:

- Interest rates
- Yield volatility
- Security structural transformation
- Defaults and severities
- Mortgage prepayments
- MBS spread
- Housing market fundamentals
- Government and regulatory policy

**You should consider the fund's investment objectives, risks, and charges and expenses carefully before investing. ### Changes in Bond Prices if Interest Rates Rise 1%

This hypothetical illustration of the effects of rising interest rates on returns is for illustrative purposes only and does not account for all factors that may potentially impact returns.

The portfolio is managed by First Trust Advisors L.P. Day-to-day management decisions are made by:

### Jim Snyder, Portfolio Manager | First Trust Securitized Products Group

Mr. Snyder has over 35 years of investment experience and joined First Trust in 2013. Prior to joining First Trust, he worked as a Senior Portfolio Manager at Fort Sheridan Advisors. In his career, Mr. Snyder has led several mortgage trading and portfolio groups at Deerfield Capital, Spyglass Capital & Trading and American Express Financial Advisors. Mr. Snyder managed AXP Federal Income Fund and developed mortgage trading strategies for Spyglass Capital and Deerfield's Mortgage REIT and Opportunity Fund. Mr. Snyder holds a B.S. and M.A. in Economics from DePaul University and an MBA from University of Chicago Booth School of Business.

### Jeremiah Charles, Senior Portfolio Manager | First Trust Securitized Products Group

Mr. Charles has over 21 years of investment experience and joined First Trust in 2013. Prior to joining First Trust, he worked as a Vice President of MBS at CRT Capital. Before joining CRT in 2011, Mr. Charles spent 6 years with Deerfield Capital Management LLC as a Senior Vice President and Senior Portfolio Manager for the Mortgage Trading team. He began his professional career as an Analyst at Piper Jaffray. Mr. Charles holds a B.S. in Finance from the Leeds School of Business at the University of Colorado, and a M.S. in Real Estate Finance with Honors from the Charles H. Kellstadt Graduate School of Business at DePaul University.

### Risk Considerations

**You could lose money by investing in a fund. An investment in a fund is not a deposit of a bank and is not insured or guaranteed. There can be no assurance that a fund's objective(s) will be achieved. Investors buying or selling shares on the secondary market may incur customary brokerage commissions. Please refer to each fund's prospectus and Statement of Additional Information for additional details on a fund's risks. The order of the below risk factors does not indicate the significance of any particular risk factor.**

Asset-backed securities are a type of debt security and are generally not backed by the full faith and credit of the U.S. government and are subject to the risk of default on the underlying asset or loan, particularly during periods of economic downturn.

Unlike mutual funds, shares of the fund may only be redeemed directly from a fund by authorized participants in very large creation/redemption units. If a fund's authorized participants are unable to proceed with creation/redemption orders and no other authorized participant is able to step forward to create or redeem, fund shares may trade at a premium or discount to a fund's net asset value and possibly face delisting and the bid/ask spread may widen.

During periods of falling interest rates if an issuer calls higher-yielding debt instruments, a fund may be forced to invest the proceeds at lower interest rates, likely resulting in a decline in the fund's income.

A fund that effects all or a portion of its creations and redemptions for cash rather than in-kind may be less tax-efficient.

A fund may be subject to the risk that a counterparty will not fulfill its obligations which may result in significant financial loss to a fund.

An issuer or other obligated party of a debt security may be unable or unwilling to make dividend, interest and/or principal payments when due and the value of a security may decline as a result.

Ratings assigned by a credit rating agency are opinions of such entities, not absolute standards of credit quality and they do not evaluate risks of securities. Any shortcomings or inefficiencies in the process of determining credit ratings may adversely affect the credit ratings of the securities held by a fund and their perceived or actual credit risk.

Current market conditions risk is the risk that a particular investment, or shares of the fund in general, may fall in value due to current market conditions. For example, changes in governmental fiscal and regulatory policies, disruptions to banking and real estate markets, actual and threatened international armed conflicts and hostilities, public health crises, among other significant events, could have a material impact on the value of the fund's investments.

A fund is susceptible to operational risks through breaches in cyber security. Such events could cause a fund to incur regulatory penalties, reputational damage, additional compliance costs associated with corrective measures and/or financial loss.

Investments in debt securities subject the holder to the credit risk of the issuer and the value of debt securities will generally change inversely with changes in interest rates. In addition, debt securities generally do not trade on a securities exchange making them less liquid and more difficult to value.

The use of derivatives instruments involves different and possibly greater risks than investing directly in securities including counterparty risk, valuation risk, volatility risk, and liquidity risk. Further, losses because of adverse movements in the price or value of the underlying asset, index or rate may be magnified by certain features of the derivatives.

Extension risk is the risk that, when interest rates rise, certain obligations will be paid off by the issuer (or other obligated party) more slowly than anticipated, causing the value of these debt securities to fall. Rising interest rates tend to extend the duration of debt securities, making their market value more sensitive to changes in interest rates.

Floating rate securities are structured so that the security's coupon rate fluctuates based upon the level of a reference rate. As a result, the coupon on floating rate securities will generally decline in a falling interest rate environment, causing a fund to experience a reduction in the income it receives from the security. A floating rate security's coupon rate resets periodically according to the terms of the security. Consequently, in a rising interest rate environment, floating rate securities with coupon rates that reset infrequently may lag behind the changes in market interest rates.

The risk of a position in a futures contract may be very large compared to the relatively low level of margin a fund is required to deposit and a relatively small price movement in a futures contract may result in immediate and substantial loss relative to the size of margin deposit.

High yield securities, or "junk" bonds, are less liquid and are subject to greater market fluctuations and risk of loss than securities with higher ratings, and therefore, are considered to be highly speculative.

A fund's income may decline when interest rates fall or if there are defaults in its portfolio.

A fund may be a constituent of one or more indices or models which could greatly affect a fund's trading activity, size and volatility.

As inflation increases, the present value of a fund's assets and distributions may decline.

The yield on an interest-only security is extremely sensitive to the rate of principal payments on the underlying mortgage assets and a rapid payment rate may have an adverse effect on a fund's yield to maturity from these securities. Conversely, principal-only securities tend to decline in value if prepayments are slower than anticipated.

Interest rate risk is the risk that the value of the debt securities in a fund's portfolio will decline because of rising interest rates. Interest rate risk is generally lower for shorter term debt securities and higher for longer-term debt securities.

Inverse floating rate securities are a type of debt instrument that has a coupon rate that varies inversely with a benchmark rate. Inverse floaters create effective leverage and will typically be more volatile and involve greater risk than the fixed rate municipal bonds underlying the inverse floaters.

To the extent a fund invests in floating or variable rate obligations that use the London Interbank Offered Rate ("LIBOR") as a reference interest rate, it is subject to LIBOR Risk. LIBOR has ceased to be made available as a reference rate and there is no assurance that any alternative reference rate, including the Secured Overnight Financing Rate ("SOFR"), will be similar to or produce the same value or economic equivalence as LIBOR. The unavailability or replacement of LIBOR may affect the value, liquidity or return on certain fund investments and may result in costs incurred in connection with closing out positions and entering into new trades. Any potential effects of the transition away from LIBOR on a fund or on certain instruments in which a fund invests is difficult to predict and could result in losses to the fund.

Certain fund investments may be subject to restrictions on resale, trade over-the-counter or in limited volume, or lack an active trading market. Illiquid securities may trade at a discount and may be subject to wide fluctuations in market value.

The portfolio managers of an actively managed portfolio will apply investment techniques and risk analyses that may not have the desired result.

Market risk is the risk that a particular security, or shares of a fund in general may fall in value. Securities are subject to market fluctuations caused by such factors as general economic conditions, political events, regulatory or market developments, changes in interest rates and perceived trends in securities prices. Shares of a fund could decline in value or underperform other investments as a result. In addition, local, regional or global events such as war, acts of terrorism, spread of infectious disease or other public health issues, recessions, natural disasters or other events could have significant negative impact on a fund.

A fund faces numerous market trading risks, including the potential lack of an active market for fund shares due to a limited number of market makers. Decisions by market makers or authorized participants to reduce their role or step away in times of market stress could inhibit the effectiveness of the arbitrage process in maintaining the relationship between the underlying values of a fund's portfolio securities and a fund's market price.

Mortgage-related securities are more susceptible to adverse economic, political or regulatory events that affect the value of real estate.

There are no government or agency guarantees of payments in securities offered by non-government issuers, therefore they are subject to the credit risk of the issuer. Non-agency securities often trade "over-the-counter" and there may be a limited market for them making them difficult to value.

A fund and a fund's advisor may seek to reduce various operational risks through controls and procedures, but it is not possible to completely protect against such risks. The fund also relies on third parties for a range of services, including custody, and any delay or failure related to those services may affect the fund's ability to meet its objective.

The prices of options are volatile and the effective use of options depends on a fund's ability to terminate option positions at times deemed desirable to do so. There is no assurance that a fund will be able to effect closing transactions at any particular time or at an acceptable price.

High portfolio turnover may result in higher levels of transaction costs and may generate greater tax liabilities for shareholders.

The market price of a fund's shares will generally fluctuate in accordance with changes in the fund's net asset value ("NAV") as well as the relative supply of and demand for shares on the exchange, and a fund's investment advisor cannot predict whether shares will trade below, at or above their NAV.

Prepayment risk is the risk that the issuer of a debt security will repay principal prior to the scheduled maturity date. Debt securities allowing prepayment may offer less potential for gains during a period of declining interest rates, as a fund may be required to reinvest the proceeds of any prepayment at lower interest rates.

A fund may be unable to sell a restricted security on short notice or only sell them at a price below current value.

Short selling creates special risks which could result in increased gains or losses and volatility of returns. Because losses on short sales arise from increases in the value of the security sold short, such losses are theoretically unlimited.

A fund with significant exposure to a single asset class, country, region, industry, or sector may be more affected by an adverse economic or political development than a broadly diversified fund.

Trading on an exchange may be halted due to market conditions or other reasons. There can be no assurance that a fund's requirements to maintain the exchange listing will continue to be met or be unchanged.

Securities issued or guaranteed by federal agencies and U.S. government sponsored instrumentalities may or may not be backed by the full faith and credit of the U.S. government.

A fund may hold securities or other assets that may be valued on the basis of factors other than market quotations. This may occur because the asset or security does not trade on a centralized exchange, or in times of market turmoil or reduced liquidity. Portfolio holdings that are valued using techniques other than market quotations, including "fair valued" assets or securities, may be subject to greater fluctuation in their valuations from one day to the next than if market quotations were used. There is no assurance that a fund could sell or close out a portfolio position for the value established for it at any time.

The purchase of securities on a when-issued, TBA ("to be announced"), delayed delivery or forward commitment basis may give rise to investment leverage and increase a fund's volatility and exposure to default.

Zero coupon bonds do not pay interest on a current basis, they may be highly volatile, and they do not produce cash flow. A fund could be forced to liquidate zero coupon bond securities at an inopportune time to generate cash to distribute to shareholders as required by tax laws.
